Science 281:375-388(1998).
-1- FUNCTION: 355-388 (1998).
-1- SUBCELLULAR LOCATION: Tail-anchored membrane protein (Potential).
-1- SIMILARITY: Belongs to the secE/SEC61-gamma family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

-I-FUNCTION: This procein is one of the 16S ribosomal RNA binding proceins (By similarity).
-I-SIMILARITY: Belongs to the S15P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-NOV-1995 (Rel. 32, Last sequence update)

Andoh T., Nagasawa H.;
"Two molecular forms of insulin from barfin flounder, Verasper moseri, are derived from a single gene.";
are derived from a single gene.";
2001. Sci. 15:931-937(1998)
-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synchesis in liver.
-!- SUBGNIT: Heterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SPECIES=L.americanus;

                                                                                 Hoppe-Seyler's Z. Physiol. Chem. 350:1286-1288(1969).

-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synthesis in liver.

-!- SUBUNIT: Heterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adams M.D., Ceiniker S.E., Holt R.A., Evans C.A., Gocayne J.D., Amanatides P.G., Scherer S.E., Li P.W., Hoskins R.A., Galle R.F., George R.A., Lewiss S.E., Richards S., Ashburner M., Henderson S.N., Sutton G.G., Mortman J.R., Yandell M.D., Zhang Q., Chen L.X., Brandon R.C., Rogers Y.-H.C., Blazej R.G., Champe M., Pfelifer B.D.

                                                                                                                                                                                                                          SEQUENCE FROM N.A.

Canty J.M., Young R.F., Fallavollita J.A.;

In Facilitative glucose transporter. This isoform likely mediates the bidirectional transfer of glucose across the plasma mediates the bidirectional transfer of glucose membrane of hepatocytes and is responsible for uptake of glucose by the beta cells, may comprise part of the glucose-sensing mechanism of the beta cell. May also participate with the Na(+)/glucose cotransporter in the transcellular transport of glucose in the small intestine and kidney (By similarity).

SUBCELLULAR LOCATION: Integral membrane protein.

SIMILARITY: Belongs to the sugar transporter family. Glucose transporter subfamily.
28-FEB-2003 (Rel. 41, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
28-Oute carrier family 2, facilitated glucose transporter, member 2 (Glucose transporter type 2, liver) (Fragment).
SLC2A2 OR GLUT2.
                                                                                                                       Sus scrofa (Pig).

Benome sequence of Thermotoga maritima.";

Nature 339:323-329(1999).

-I FUNCTION: Decarboxylation of S-adenosylmethionine provides the minopropyl modety required for spermidine biosynthesis from purescine (By similarity).

-I CATALYTIC ACTIVITY: S-adenosyl-L-methionine = (S-deoxy-S-adenosyl) (3-minopropyl methylsulfonium salt + CO(2).

-I CATALYTIC Belongs to the prokaryotic AdometDC family. Subfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CHAIN (BY SIMILARITY).

CLEAVAGE (NONHYDROLYTIC) (BY SIMILARITY).

CONVERTED TO A PYRUVOYL GROUP (BY SIMILARITY).

catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pythindinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).
-!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflawin + 4 (1-D-ribityl)amino-2,6-dihydroxypyrimidine.
-!- PATHWAY: Riboflavin biosynthesis; last step.
-!- PATHWAY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=AFCC 43049;

The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By

Substitution of arginine for lysine 134 alters electrostatic
T parameters of the active site in shark Cu,Zn superoxide dismutase.";
FERS Lett. 250:49-52(1989).
T PERS Lett. 250:49-52(1989).
T - FUNCTION: Destroys radicals which are normally produced within the calls and which are toxic to biological systems.
T - CATALIVITY: Sauperoxide + 2 H(+) = 0(2) + H(2)0(2).
T - CATALIVITY: Bainds 1 copper fon and 1 zinc ion per subunit.
T - SUBCELLUIAR LOCATION: Cytoplasmic.

-1- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-
ribityl-amino-2.4 (1H.3H)-pyrimidinhedione and L-3.4-dihydrohy.2-
butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-
amino-2,4 (HH.3H)-pyrimidinedione with L-3,4-dihydrohy-2-
butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflavin + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.
riboflavin + 1-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.
-!- PATHWAY: Riboflavin biosynthesis; last step.
-!- SIMILARITY: Belongs to the DMRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDIINE-88115138; PubMed-2828309; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Cloning of genes encoding a 15,000-dalton peptidoglycan-associated outer membrane lipoprotein and an antigenically related 15,000-dalton J.
